SUBJ: Preliminary Assessment Report for
Einfield Labor Camp
Lynden, Washington

REF: TDD F10-8708-14

CC: Deborah Flood, HWD-SM, USEPA, Region X
Thomas Tobin, E&E, Seattle
Jeffrey Villnow, FIT-PM, E&E, Seattle

1. Introduction and Purpose of the Preliminary Assessment:

Pursuant to U.S. Environmental Protection Agency (EPA) Contract No. 68-01-7347 and Technical Directive Document (TDD) F10-8708-14, Ecology and Environment, Inc. (E&E) conducted a Preliminary Assessment (PA) of Einfield Labor Camp in Lynden, Washington. The PA represents the second of a three-step assessment process which begins with Site Discovery and concludes, if necessary, with a Site Inspection. The assessment process, in general, is intended to identify, compare, and rank the potential hazards associated with a particular site relative to other sites across the nation for the purpose of identifying priority sites requiring remedial responses. It does not include extensive or complete site characterization, contaminant fate determination, or quantitative risk assessment.

The Einfield Labor Camp Site PA was conducted to identify potential public health and/or environmental hazards related to the site and, if present, evaluate the need for additional investigative action. The PA is based on data derived from available files and literature pertaining to the site, communication with various local and state agencies, and a phone interview with the site owner. Information developed during the PA is summarized in Appendix A on EPA Form 2070-12.

2. Information Obtained During the File Review:

- o Site Location and Description - The site is a strawberry farm approximately 100 acres in size located in northwestern Whatcom County, in Section 22, Township 40 North, Range 2 East, approximately one mile west of the city of Lynden, Washington (1). There are many other wells providing domestic water in the area surrounding the site, some of which have also been tested for ethylene-dibromide (EDB) by local and state agencies (2,3,4,5). The population of the surrounding area is approximately 775.
- o Site History / Potential Problem(s) - In 1984, the EPA declared an emergency suspension of the use of pesticides containing ethylene dibromide (EDB) under the Federal Insecticide, Fungicide and Rodenticide Act. Prior to this suspension, EDB had been applied in Washington state as a soil fumigant for strawberry, raspberry, and seed potato cultivation. The Washington State Department of Ecology (Ecology) Social and Health Services (DSHS) and Agriculture identified EDB application sites in Skagit, Thurston, and Whatcom Counties that presented potential hazards to public health due to EDB contamination of aquifers that provide water to domestic and municipal wells. In response to these potential hazards, the Hazardous Waste Remedial Action Division of Ecology coordinated an investigation with DSHS and the County Health Departments to determine the extent of the EDB contamination at the identified sites, and to assess its impact (1).

The soil fumigant Terr-O-Cide 15, containing 40% EDB, was used to treat berry farms located to the immediate west and east of the site from 1981 to 1983. Based on Washington State Department of Agriculture (WSDA) records, the rate of application was 18 to 20 gallons per acre annually (1). Terr-O-Cide 15 was approved for application on row and field crops up to a rate of 24.4 gallons per acre (5). From Bellingham-Whatcom County Health Department (WCHD) supplied information, 68 acres within approximately 1/4 mile of the site were confirmed EDB application sites (1) (Table 1-2, Figure 1, Appendix B). There is also some suspicion that EDB was used at the Einfield site (3); however, there is no evidence to confirm this (4).

Water from the site was sampled once for EDB on July 23, 1984, by the Washington Department of Social and Health Services (DSHS). The results of this analysis indicate the presence of EDB at a concentration of 2.3 ug/l (1). No additional sampling has been done at the Einfield Labor Camp site since that time. Several wells have been sampled by DSHS, WDOE, and independently by Western Washington University. Their sampling results indicated EDB contamination of some of the domestic wells (1, 3). Not all of the wells sampled in the area have tested positive for EDB. The domestic well located on the Einfield property is currently being used

by the property owners and possibly by migrant workers (6). According to WCHD, the Einfield Labor Camp has not been notified to use bottled water (3).

- o Physical and Social Environment - Land use surrounding the site consists of agriculture and forested areas with some residential development. The predominant crop grown in the area is berries. Most of the residential development in the area is located along the perimeter of sections 22 and 23, on the Birch Bay - Lynden Road, Bob Hall Road, Loomis Trail Road, and Berthusen Road (1).

The site is located in the Bertrand Creek drainage area, which empties into the Nooksack River approximately one and half miles to the south (7). The creek and its tributaries have deep cut channel sections, vegetated with trees and brush along their banks. Terrain surrounding the site slopes generally to the south at grades less than five percent (1).

The geology of the site is characterized by glacially derived landforms and soils. As a result of glacial deposition, unconsolidated sediments extend to a depth of 800 to 1200 feet. The latest glacial episode occurred during the Sumas Stade, about 11,000 years ago. Meltwater streams during this episode built up an outwash plain, known as the Lynden Terrace, in the area surrounding the site. A shallow, unconfined aquifer in Sumas outwash deposits of sand and gravel supplies water to the Einfield Labor Camp well and others in the vicinity of the site. Well logs indicate that the water levels for this area are within four to 24 feet of the ground surface. Recharge to the aquifer is received primarily from precipitation, which averages about 49 inches per year (1).

- o Waste Types, Quantities, and Characteristics - Until 1983, EDB was widely used as a soil fumigant on at least 40 crops, principally for the control of nematodes. However, the vast majority of EDB produced was used as a lead scavenger in gasoline. In 1983, the Environmental Protection Agency cancelled all major uses of EDB (8).

Confirmed application of EDB as a soil fumigant was determined by the Bellingham-Whatcom County District of Public Health in two areas within one-half to one mile of the site location. The two areas comprise a total of 68 acres that have been used for raspberry cultivation (Table 1-2, Figure 1). Assuming that the average rate of application of EDB in these areas conforms to the figures provided by the WSDA, the total amount of EDB applied during the 1981 - 1983 period would range between twelve and fourteen metric tons (1).

- o Pollutants, Mobilization, Pathways, and Risks - The application of Terr-o-cide 15 containing 40% EDB is apparently responsible for the contamination of the aquifer supplying water to wells in the area. It is unknown to what extent the application of pesticides throughout Whatcom County may have been responsible for similar problems elsewhere (4). Due to the unconfined nature of the aquifer, the potential for contamination by substances other than EDB is present at the site.

Due to its volatility, most of the EDB applied to the soil probably has been released to the atmosphere. However, the EDB that has penetrated to the ground water may persist in detectable quantities for years. Because of EDB's toxicity and mobility, the uncontained nature of the aquifer, the multitude of potential sources of the pollutant, and the abundance of private wells in the area, it is possible that EDB contamination poses significant health risks in various areas throughout Whatcom County.

The EPA has issued a 10-day Health Advisory for EDB recommending consumption of no more than 2 liters of water per day containing 8 ug/l EDB. Health Advisories are developed by the EPA's Office of Drinking Water to provide informal technical guidance for the protection of public health. They indicate concentrations of drinking water contaminants at which adverse health effects are not expected to occur for specific periods of exposure. The Health Advisories include a margin of safety to protect sensitive members of the population. Health Advisories are intended to provide informal technical guidance to protect the public health; they are not legally enforceable standards. Generally, Health Advisories are developed for one-day, ten-day, longer-term (approximately seven years), and lifetime exposures for specific contaminants. Their development is based on noncarcinogenic end points of toxicity, and do not reflect the potential carcinogenic risk of such exposures (8).

EPA has not issued a longer-term Health Advisory due to the lack of adequate data, and a Lifetime Health Advisory has not been calculated due to the potential carcinogenic risk posed by EDB exposure. Based on the EPA's guidelines for the assessment of carcinogenic risk, EDB is classified in Group B2: Probable Human Carcinogen, indicating inadequate evidence from human studies, but adequate evidence from environmental studies.

EDB is regarded as a persistent and mobile pollutant. Since its vapor pressure is relatively high (11 mm Hg at 20° C.), volatilization is the major pathway for its removal from the soil. In the absence of volatilization, EDB is more slowly removed by microbial degradation. The half-life of EDB in the soil with removal by biodegradation has been determined to be less than eighteen weeks.

In sterile water, EDB slowly hydrolyzes with a half-life that has been estimated by various studies to be from 1,029 days to as long as 24 years. A study by the University of Florida has estimated the half-life in ground water at 22° C. to be 550 days (1).

3. Priority Assessment: None

The site cannot be scored using the HRS model since the pesticide EDB was applied legally under FIFRA.

4. Follow-up Recommendations:

Because no evidence of unapproved levels of application of EDB containing pesticides was discovered, continued investigation of the site under CERCLA is not indicated. However, contamination of the ground water at the site and in other wells in the area has been documented by various agencies over the past three years. This evidence also indicates that it is possible that the problem may be more widespread than has been observed, warranting further study of the problem by other divisions of the EPA or state and local agencies.
